DETAILED ACTION

Response

1. Receipt is acknowledged of the response filed on August 7, 2003. Claims 1-22 remain
5 for examination.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all
obviousness rejections set forth in this Office action:

10 (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in
section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are
such that the subject matter as a whole would have been obvious at the time the invention was made to a person
having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the
manner in which the invention was made.

- 15 3. Claims 1 and 2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wike, Jr.
(US 5,149,949, "Wike" hereinafter).

20 Wike teaches an optical scanner for reading barcode code (col. 1, lines 6; col. 2, lines
23+) comprising light source (col. 2, lines 66+), which generates a raster scanning beams (see
claim 4). As shown in figure 2, the target are being scanned is comprised of brighter area and
less bright area. Obviously, the area with greater scanning beam density would be brighter
compared to area with less illumination and can serve as a alignment guidance for the users .
Although Wike refers the optical code as "bar code" throughout the patent, it is the Examiner's
view that the barcode can certainly be one-dimensional or two-dimensional code format.

Allowable Subject Matter

Art Unit: 2876

4. Claims 3-22 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

5. The following is a statement of reasons for the indication of allowable subject matter: the

5 claims are directed at a raster code scanner reading two-dimensional optical code, and in particular scanning beam creates the region of apparent greater brightness for assisting in alignment of two-dimensional scanning pattern. As found in many references provided by Applicant, alignment of the reader to the target (i.e., spotter beams, cross-hair marker, and other form of mark around the target or in the viewing area of the reader) is well known in the art, and
10 widely used in the industry. However, the cited references, taken alone or in combinations, fail to suggest or teach the scanner producing an outgoing beam wherein the scanning spot is shaped differently from the shape of other regions as set forth in the claims.

Response to Remarks

15 6. Applicant's remarks filed on August 7, 2003 have been carefully considered. In doing so, Examiner agrees with Applicant that there is a single light source, which illuminates target area with different brightness. In view of Applicant's argument, this Office Action is issued non-final.

Conclusion

Art Unit: 2876

I. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure: Tamburrini et al. (US 6,575,368) disclose an optical reader illuminating with varying intensity.
